B5U1 Harvesting Power from Rotten Tomatoes

Activity 1 Group member: _____

Summarize the reading text based on the following pictures.

		
🍅💗A lovely tomato family go to take a family photo.💗🍅	It got rotten, and gave off some stinky smell.😍	The earth is having fever due to global warming.
		
Researchers convert rotten tomatoes into electricity  	Tomatoes make power and power turns into electricity . 	l'm an excited and naughty tomato battery ,wanna use me? 🍅🍅🍅🍅🍅🍅🍅🍅🍅🍅🍆🍆🍆🍆🍆

Activity 2

The following are some ways to produce electricity.

1. Discuss with your group members which way surprises you the most.
2. Read the hints and match the hints with the pictures.
3. Research what surprises you the most

○  **Lemon's Chemical Change**	○  **Trains' Energy Change**
○  **Cows' Manure**	○  **Playing Golf**
○  **Dance Floors**	○  **Rain Drops**

I.

I think among the six ways to produce electricity_____surprises me the most, because_____.

II.

Match the hints with the picture and choose one alternative to make a group report on how it creates electricity.

Hints:

1. Burning and decomposing manure produce energy, which can be transformed into electricity. Also, they generate less CO2.
2. When braking a vehicle, the process of slowing down changes its kinetic energy into electricity.
3. We can make lemon batteries by inserting two different metals into the fruit. With the chemical changes, energy is produced.

4. When people are dancing on the dance floor equipped with unique springs, the springs are compressed. By doing so, it generates electrical currents.
5. The vibrations of raindrops can be converted into electricity. Interestingly, raindrops that fall slower produce more energy.
6. When a golf player swings the golf club, it generates kinetic energy, which can be saved for later use.

III.

Research paper

1. **Research Topic**:
    - Select a specific aspect of cow's manure as a renewable energy source that interests you. For example, you could explore how farmers perceive the use of cow's manure for renewable energy.
2. **Research and Background Information**:
    - Gather basic information about cow's manure, its composition, and its potential as a renewable energy source.
    - Use textbooks, online resources, and articles as references to understand the topic.
3. **Research Question**:
    - Develop a research question that focuses on understanding people's experiences or perceptions related to cow's manure as a renewable energy source. For instance, "How do farmers feel about using cow's manure for renewable energy?"
4. **Literature Review**:
    - Conduct a simplified literature review to explore what existing research says about the topic. Focus on qualitative studies or relevant articles.
5. **Select Your Participants**:
    - Identify who you will interview or survey for your research. This might include farmers, experts, or community members with knowledge on the subject.
6. **Data Collection Methods**:
    - Choose qualitative data collection methods, such as interviews or surveys.
    - Develop open-ended questions to gather insights into participants' thoughts and experiences.
7. **Data Collection**:
    - Conduct interviews or surveys with your selected participants.
    - Take detailed notes or record the interviews (with participants' permission) for later analysis.
8. **Data Analysis**:
    - Review your interview notes or survey responses.
    - Identify recurring themes, patterns, and insights related to participants' experiences and perceptions.
9. **Presentation of Findings**:
    - Organize your findings into themes or categories.
    - Use quotes from your interviews or surveys to support your findings.
10. **Discussion**:
    - Discuss the themes or patterns you identified and what they reveal about the topic.
    - Consider the implications of your findings and their significance.
11. **Conclusion**:
    - Summarize the key insights gained from your qualitative research.
    - Reflect on how your research question was addressed through participants' experiences and perceptions.

12. **Recommendations**:
    - Offer suggestions or recommendations based on your findings, such as potential areas for further research or practical applications.
13. **References**:
    - Submit your research paper according to your teacher's instructions.
